CASE STUDY

Retrofit Strathaven

By Climate Action Strathaven

Helping the local community to make their homes more energy efficient, through facilitating works that upgrade the fabric of the building known as retrofitting.

The project raises awareness with residents on the benefits of installing energy efficiency measures, undertaking surveys using technologies such as thermal imaging and air tightness testing and through hosting events at their retrofit demonstration suite.

Professional design skills are utilised to inform the works required and ensure that issues of mould and dampness are not created through poor advice and installation of energy efficiency measures. Through encouraging collaboration between residents with similar types of housing, economies of scale are maximised and learnings are shared between households.

By providing guidance, examples and learnings, they aim to increase the number of households who receive a good quality retrofit to their home which can save up to 70-80% of the heating energy costs.
